IN THE CLAIMS

Claim 1 has been amended as follows:

- 1. (Currently amended) An arrangement for passive gas sampling of a breathing gas in a breathing system, comprising:
 - a tube-piece having a first connector adapted to receive an inspiratory gas flow, a second connector adapted to deliver an expiratory gas flow, and a third connector adapted to deliver the inspiratory gas flow and to receive the expiratory gas flow;

a <u>single</u> measurement chamber associated with said tube-piece; and said tube-piece further having a first port disposed between said second connector and said third connector and connected to, and permanently open to, said measurement chamber, a second port disposed between said first connector and said third connector and connected to, and permanently open to, said measurement chamber and a third port disposed between said first connector and said second connector and connected to, and permanently open to, said measurement chamber.

Claim 2 has been amended as follows:

2. (Currently amended) An arrangement as claimed in claim 1 wherein said tube-piece has permanently existing flow paths therein respectively structurally configured to establish gas flow primarily between said first port and said measurement chamber and said second port when said inspiratory gas flow passes through said tube-piece, and to establish a gas flow primarily between said third port, said measurement chamber and said first port when said expiratory gas flow passes through said tube-piece.

3. (Original) An arrangement as claimed in claim 1 wherein said tubepiece comprises a fourth port disposed between said second connector and said third connector and connected to said measurement chamber.

Claim 4 has been amended as follows:

4. (Currently amended) An arrangement as claimed in claim 3 wherein said tube-piece has permanently existing flow paths therein to respectively structurally establish a gas flow primarily between said first port, said measurement chamber and said second port when said inspiratory gas flow passes through said tube-piece, and to establish a gas flow primarily between said third port, said measurement chamber and said fourth port when said expiratory gas flow passes through said tube-piece.

Add the following new claim:

5. (New) An arrangement as claimed in claim 1 wherein said measurement chamber is cylindrical.
